

# Cracking circuits for olfaction: Odors, neurons, genes and behavior

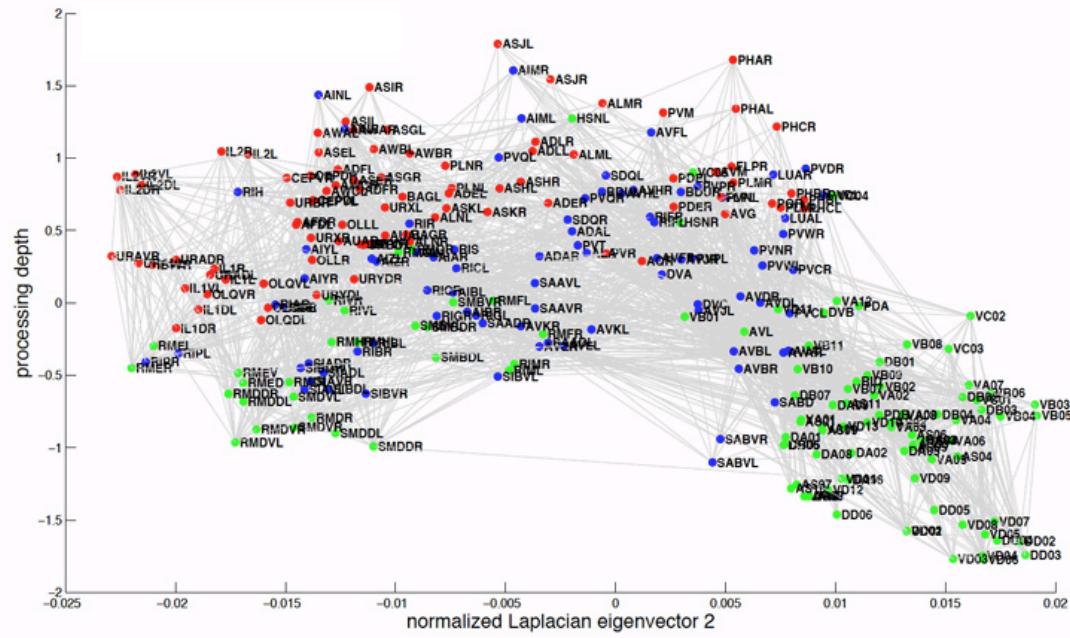

Cori Bargmann  
Howard Hughes Medical Institute  
The Rockefeller University  
New York, NY USA

The human brain:  
10 billion neurons, 10 trillion synapses  
25,000 genes

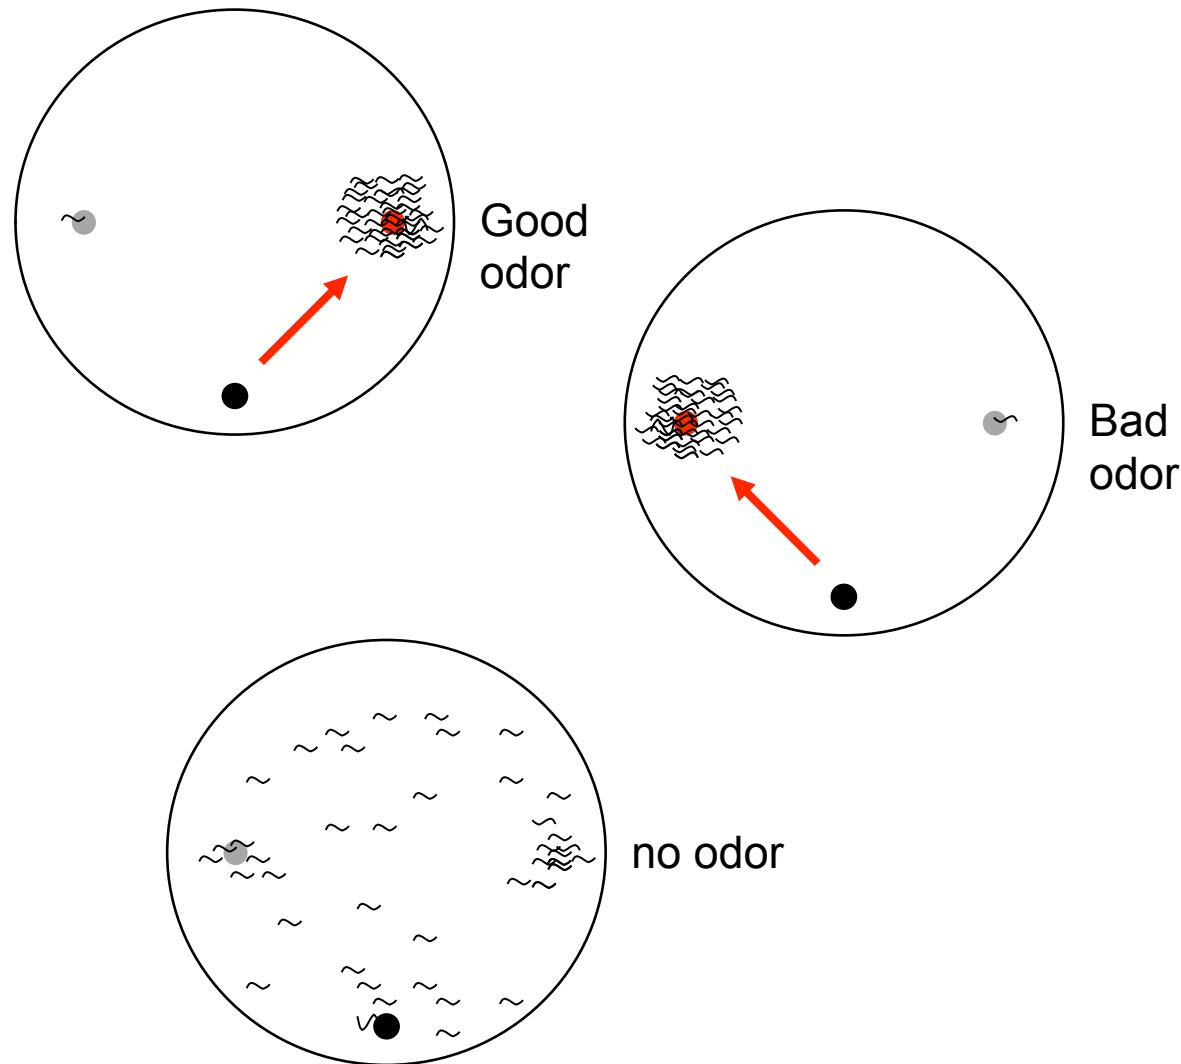

The *C. elegans* nervous system  
302 neurons, ~7,000 synapses,  
~600 gap junctions  
20,000 genes  
Known connectivity  
Similar neurotransmitters, channels,  
developmental genes as humans

# The *C. elegans* wiring diagram

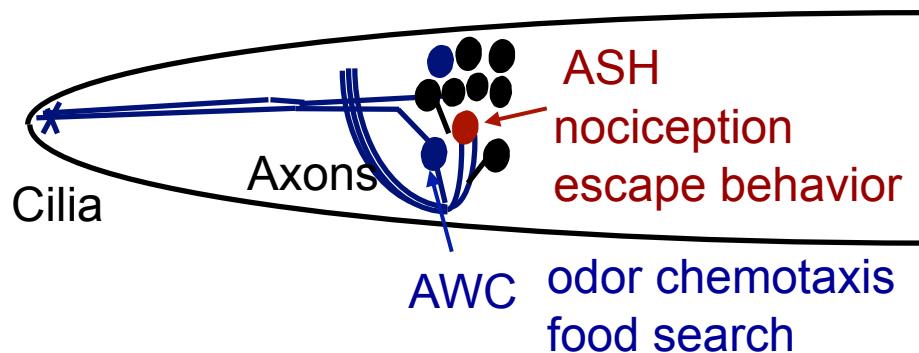

White et al., Proc Royal Soc Lond B 1986  
Varshney et al, Neurons and Cognition 2010

# *C. elegans* has robust behavioral responses to odors

# Specific neurons detect odors and initiate behaviors

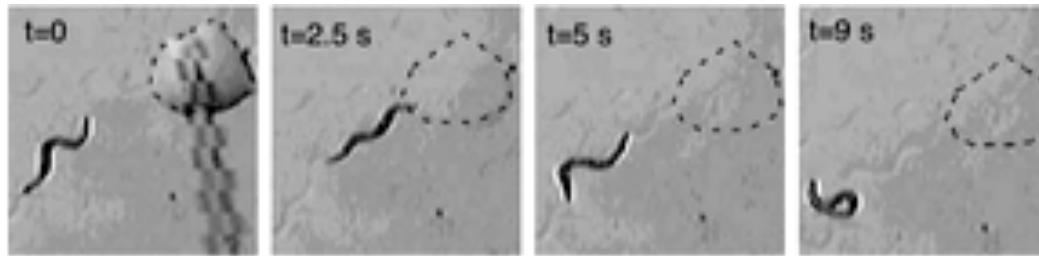

## Loss of function

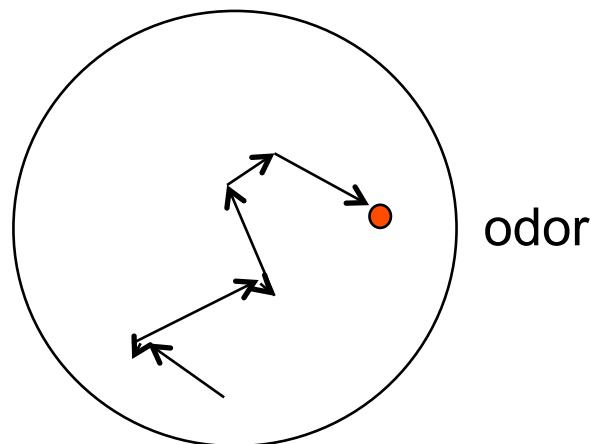

## Gain of function

Escape behavior is deterministic.

But chemotaxis is probabilistic.

Needed: a model for chemotaxis

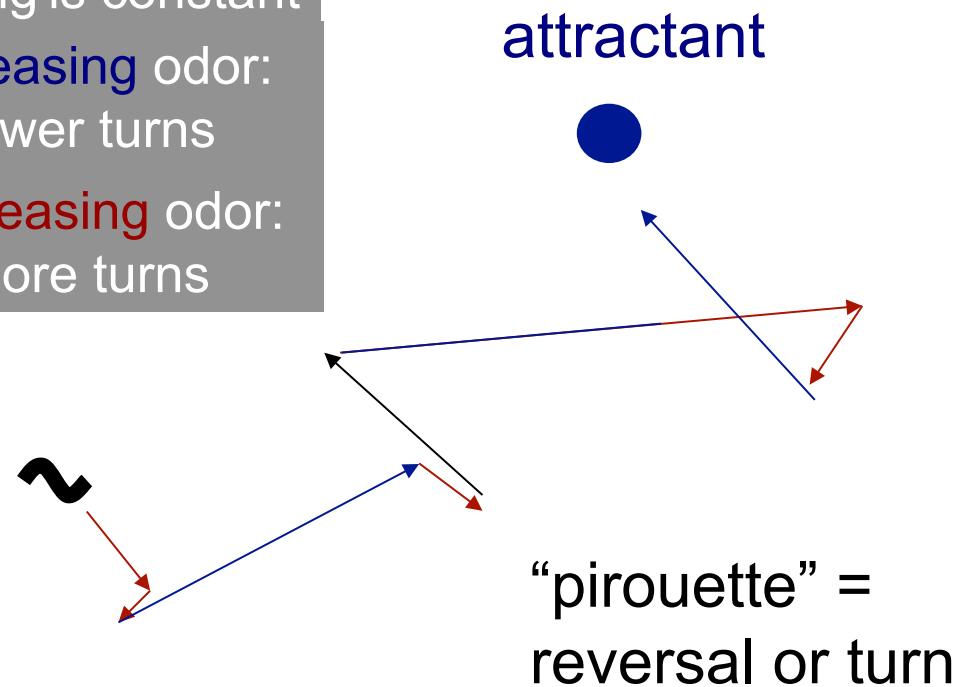

# The biased random walk for chemotaxis

## Odors regulate turning frequency

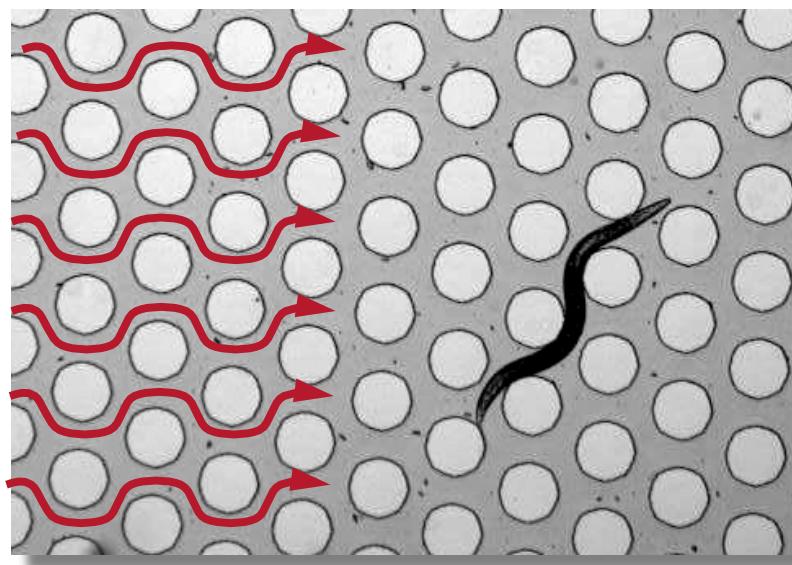

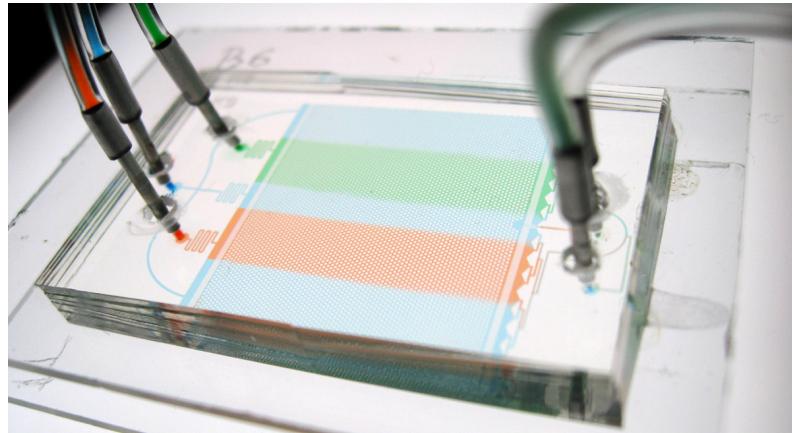

Constant odor:  
Turning is constant

Increasing odor:  
Fewer turns

Decreasing odor:  
More turns

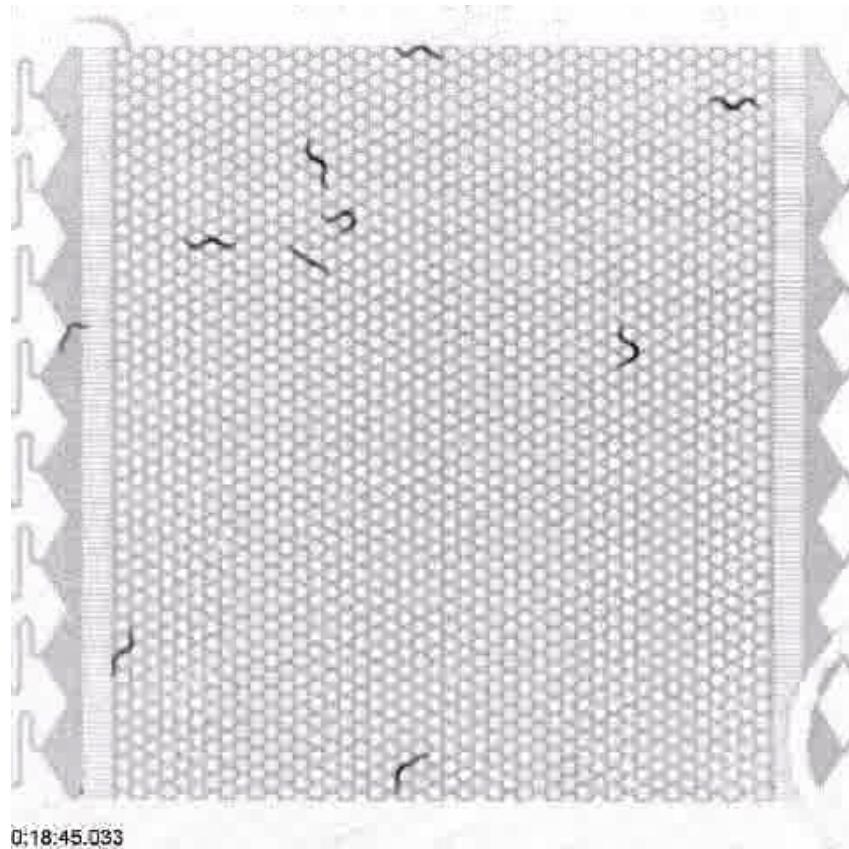

# How to test the model? A temporal gradient!

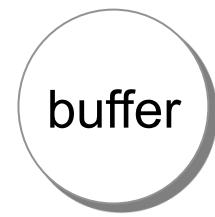

Albrecht and Bargmann, Nature Methods 2011

# Turning in temporal odor gradients resembles a biased random walk

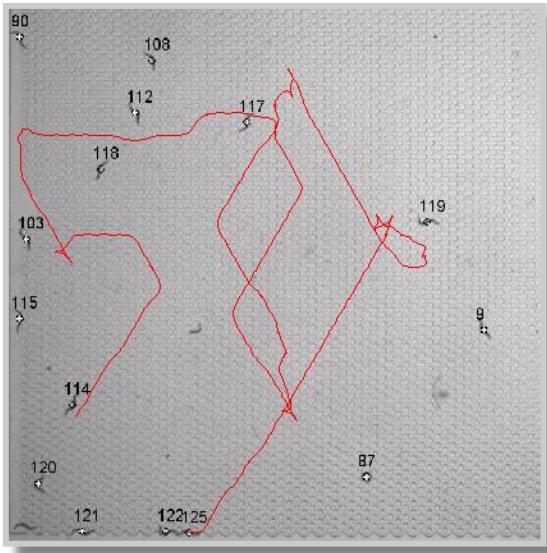

0:18:45.033

Albrecht and Bargmann, Nature Methods 2011

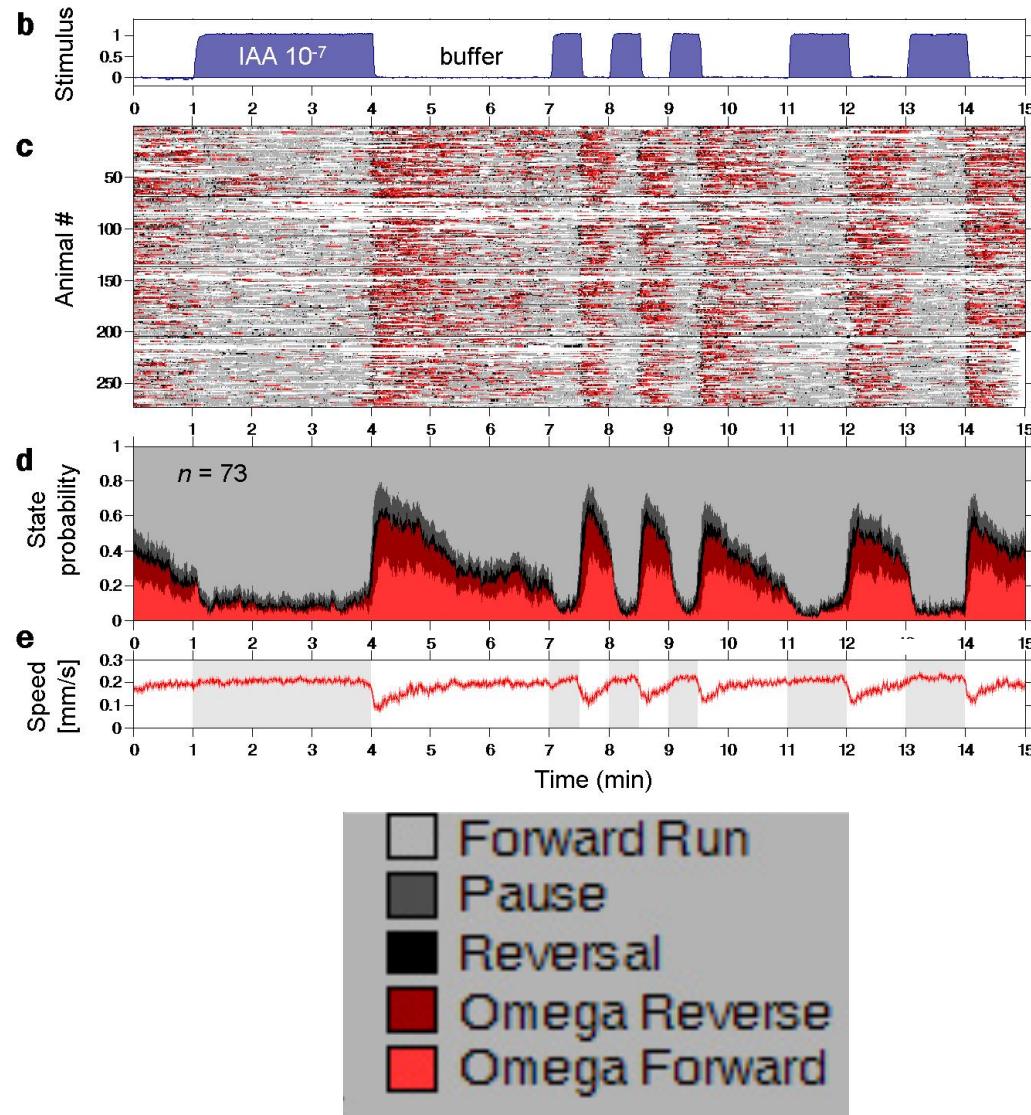

# Automatically analyze turning behaviors

Locomotion States

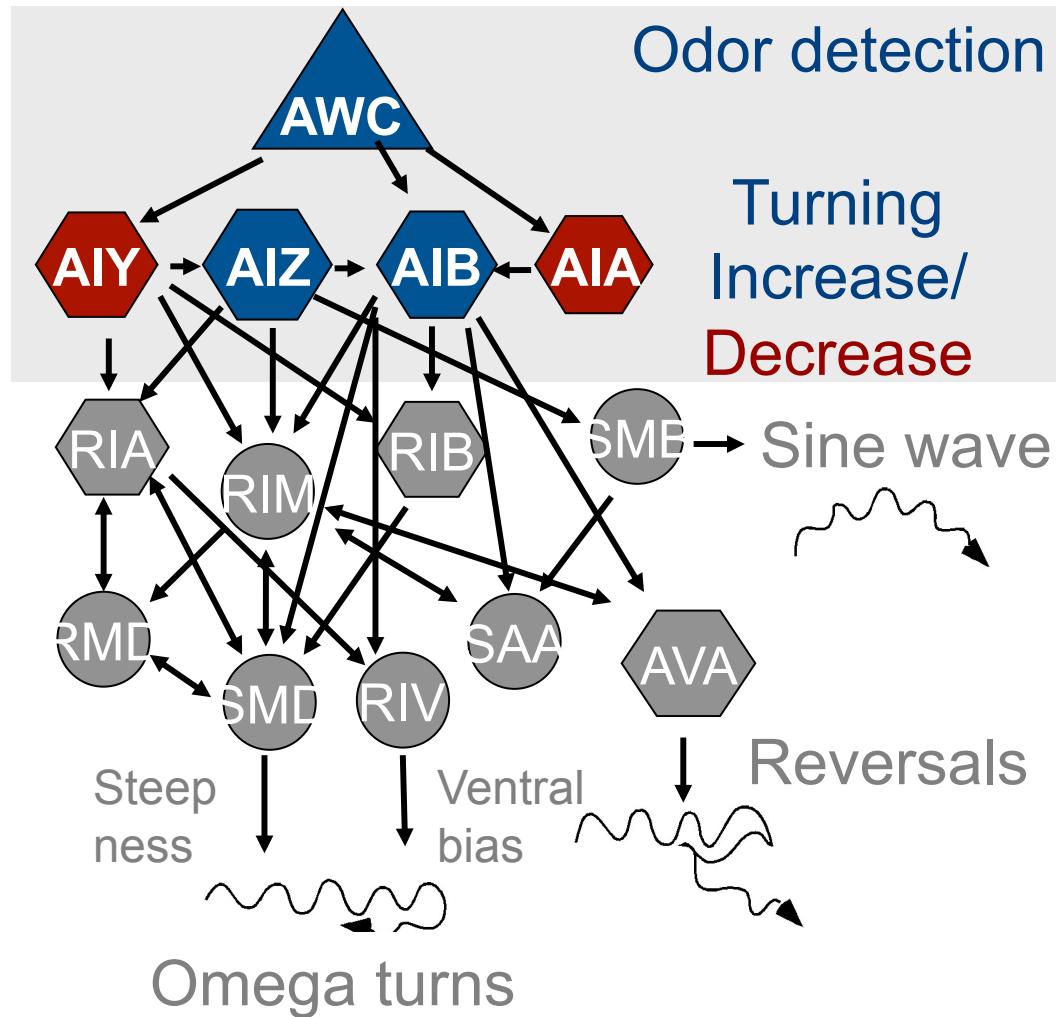

1. <i>Forward</i>	
2. <i>Forward Turn</i>	
3. <i>Pause</i>	
4. <i>Reversal</i>	
5a. <i>Pirouette rev.</i>	
5b. <i>Pirouette fwd.</i>	

# A quantitative view of chemotaxis

Albrecht and Bargmann, Nature Methods 2011

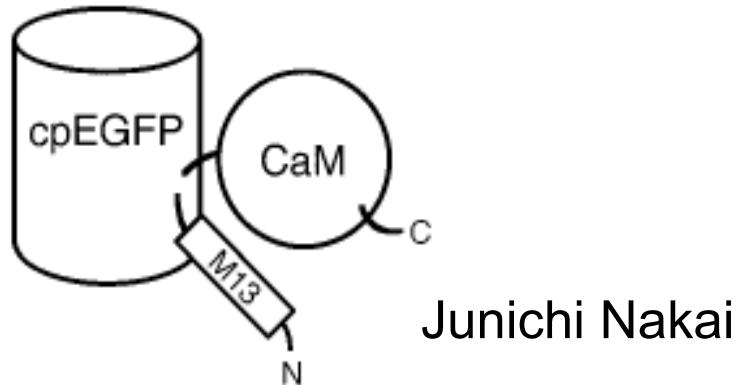

# A circuit for odor chemotaxis and food search

Gray et al., PNAS 2005

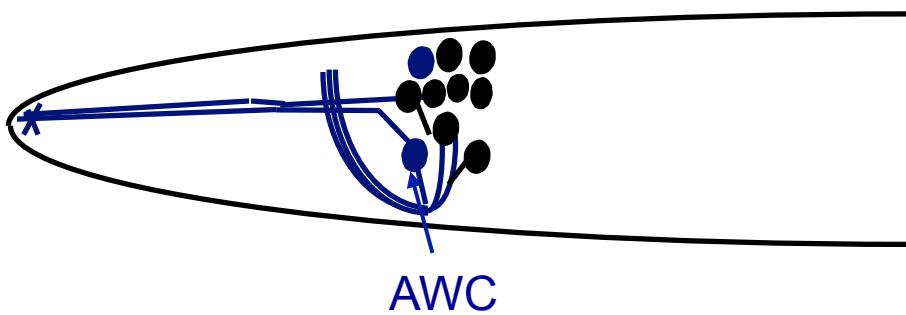

# How do neurons respond to odors?

1. Genetically-encoded calcium indicator

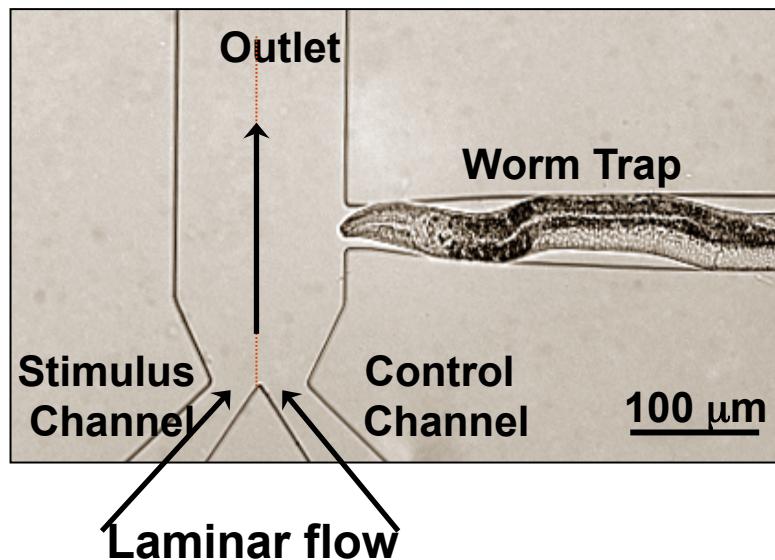

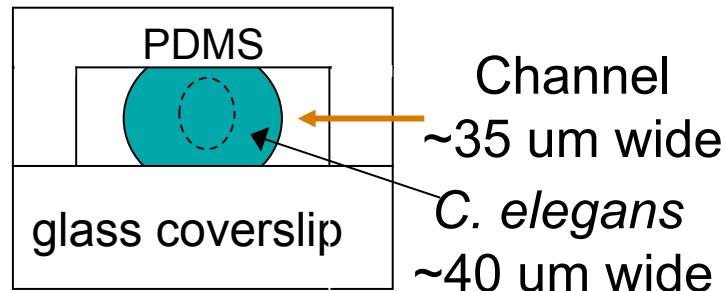

Junichi Nakai

2. Cell type-specific promoters

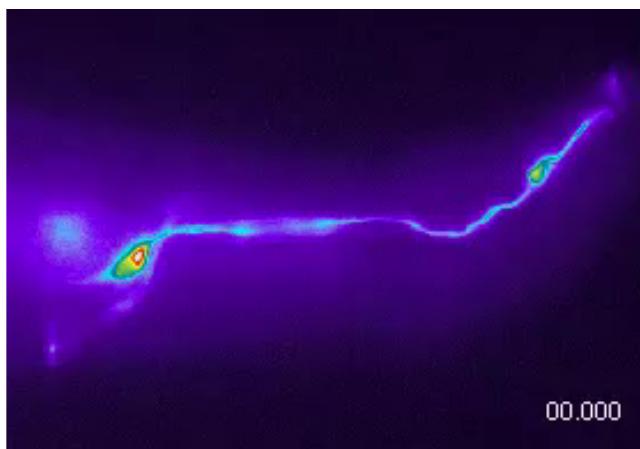

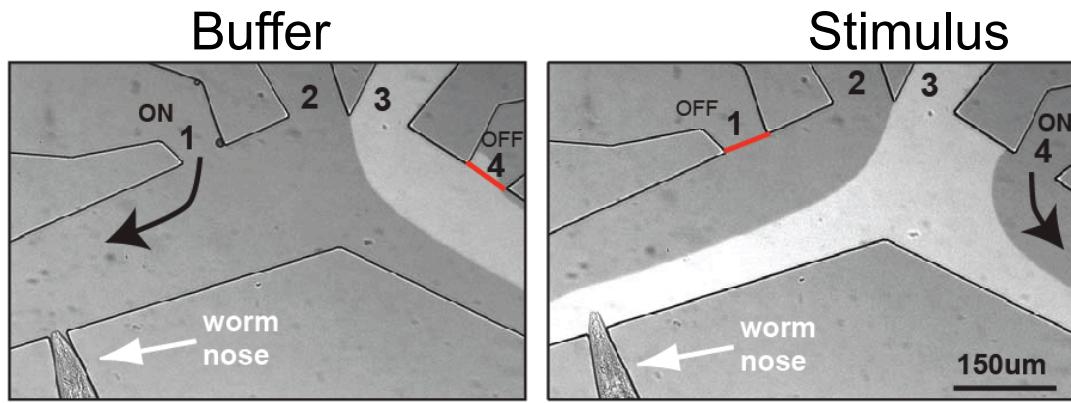

### 3. Odor delivery: Microfabricated worm trap

cross sectional view:

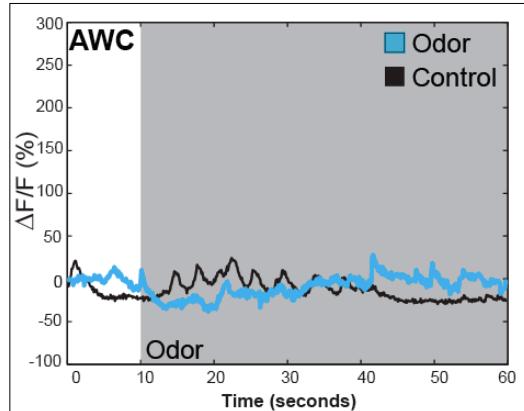

Chronis et al., Nature Methods 2007

# Delivering odor and imaging activity in a microfluidic chip

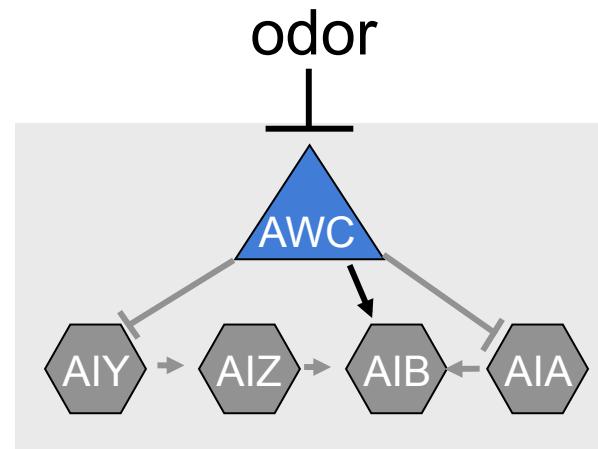

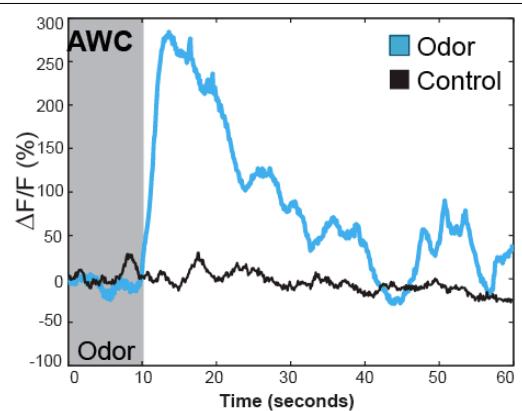

# Odor removal activates AWC

Odor addition

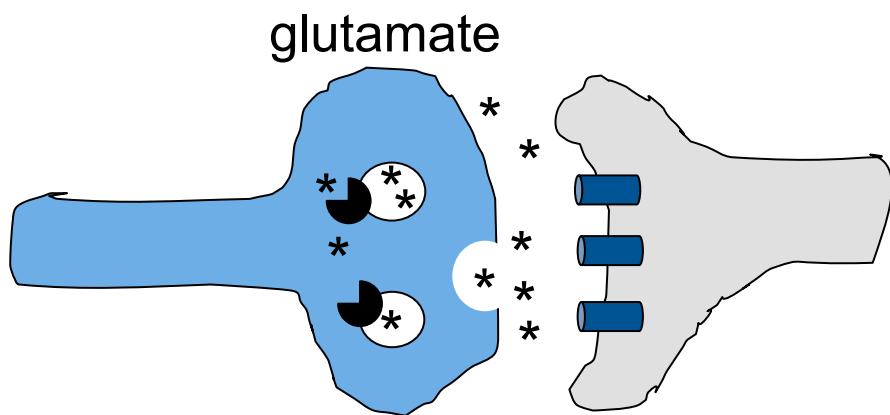

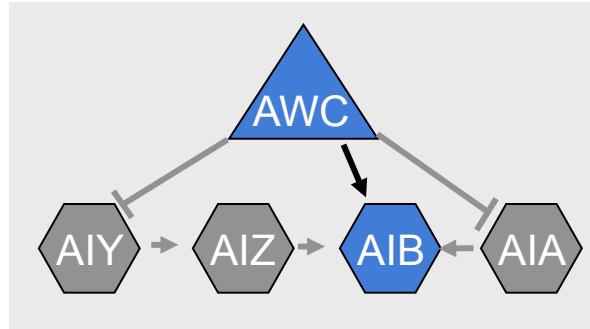

Odor removal

Chalasani et al., Nature 2007

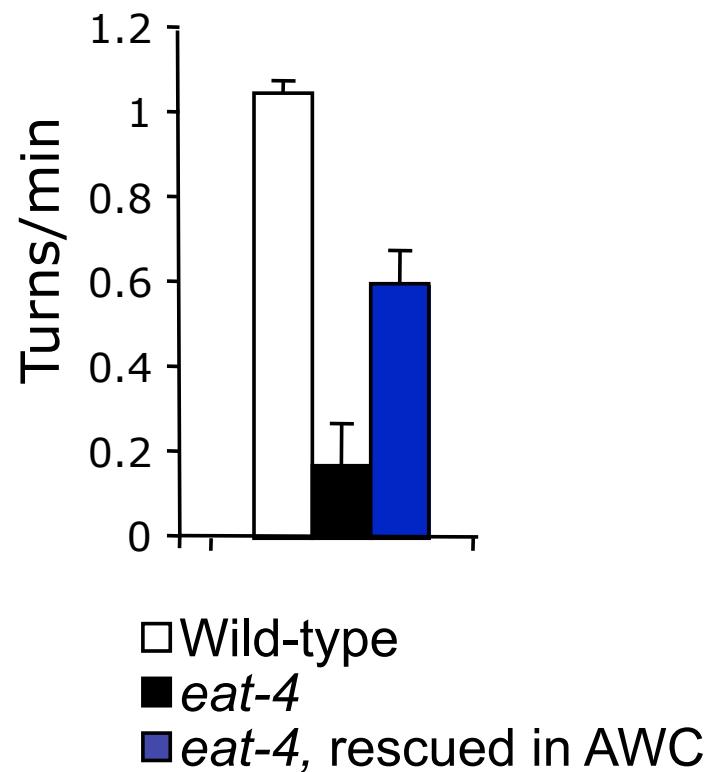

# How does AWC communicate with target neurons?

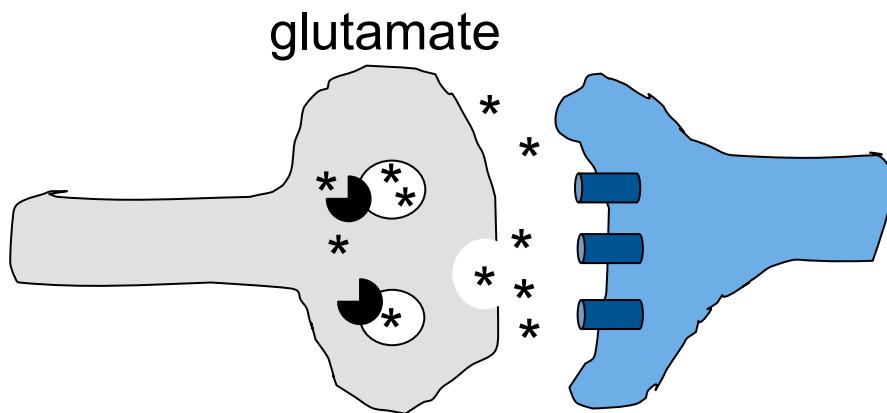

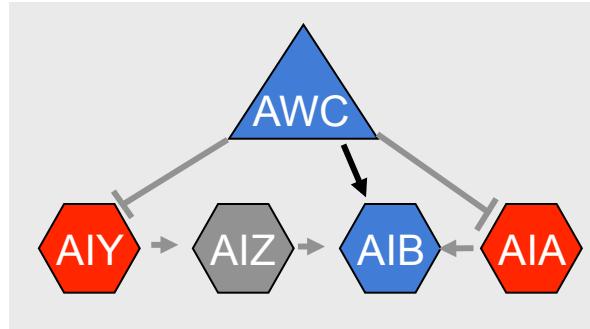

Vesicular Glutamate Transporter  
= EAT-4

Glutamate is the AWC neurotransmitter  
Glutamate from AWC promotes turning

Quantitative response to odor/food removal

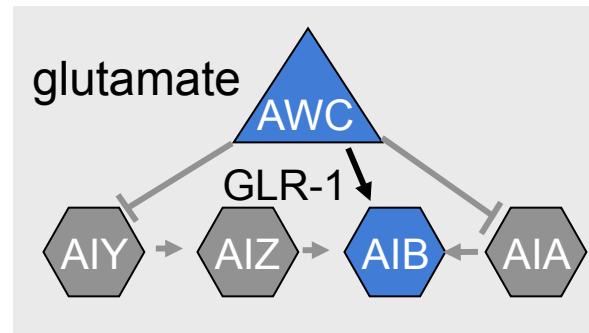

# How does AWC communicate with target neurons?

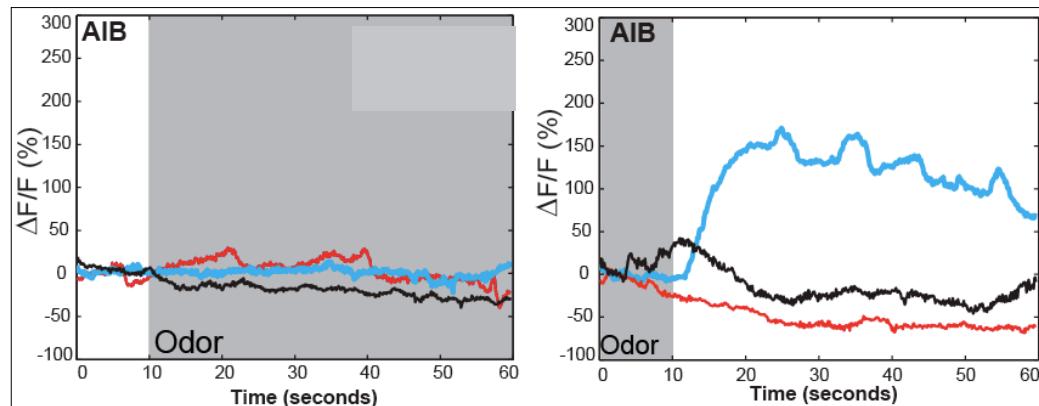

**Glutamate receptors:**  
Cation channel: GLR-1  
Anion channel: GLC-3  
(and many others)

# AWC activates AIB through GLR-1, an AMPA-type excitatory glutamate receptor

## Calcium imaging in AIB

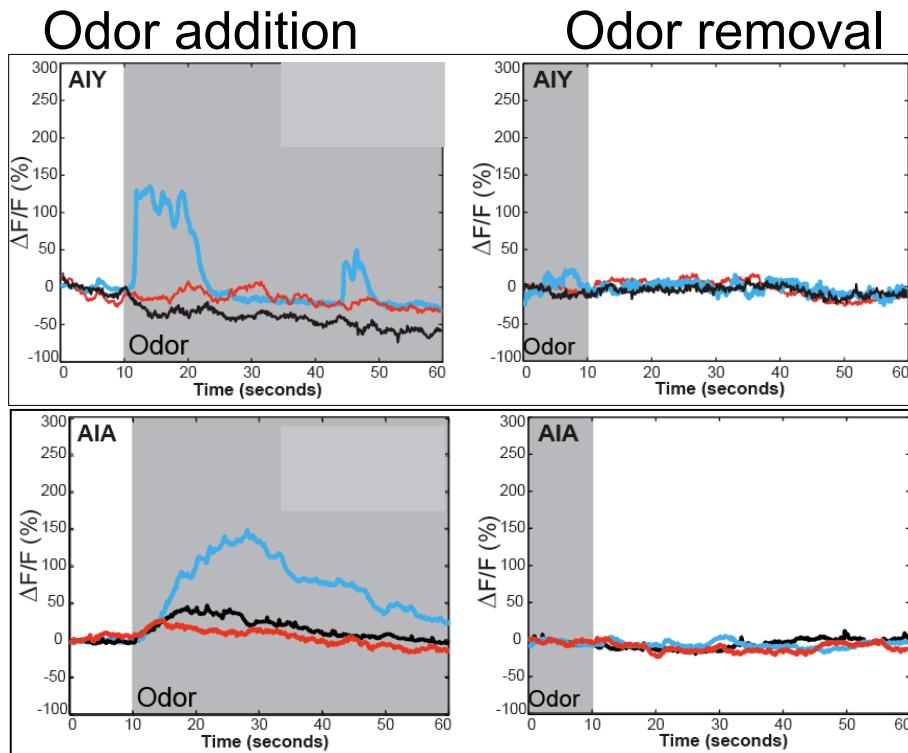

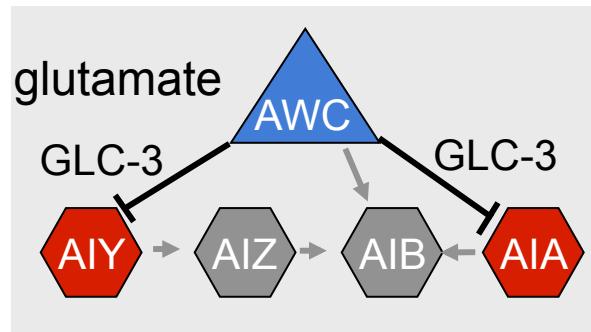

Odor addition      Odor removal

- Wild-type
- *glr-1* mutant
- AWC ablation

Chalasani et al., Nature 2007

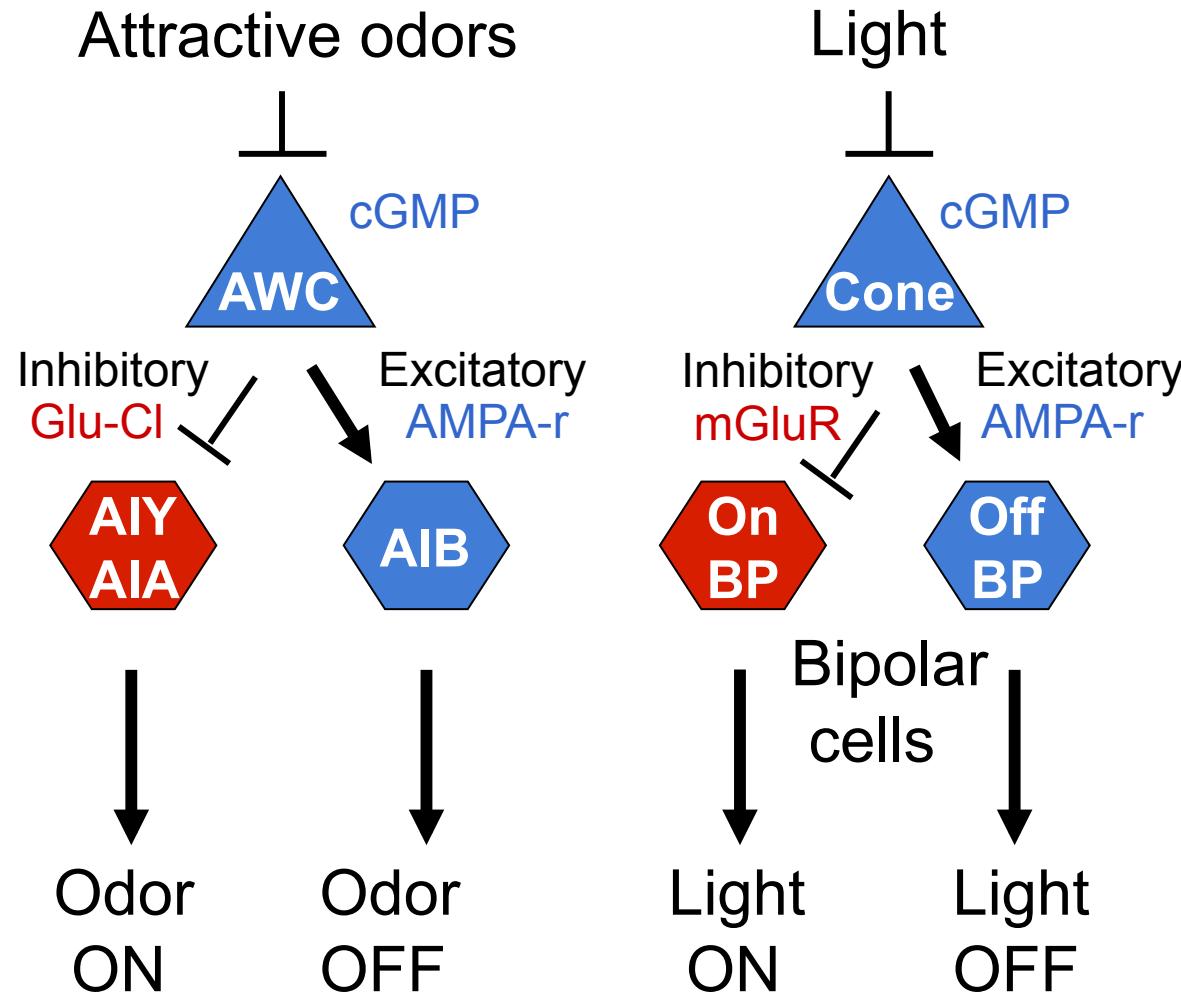

# AWC inhibits AIA and AIY through GLC-3

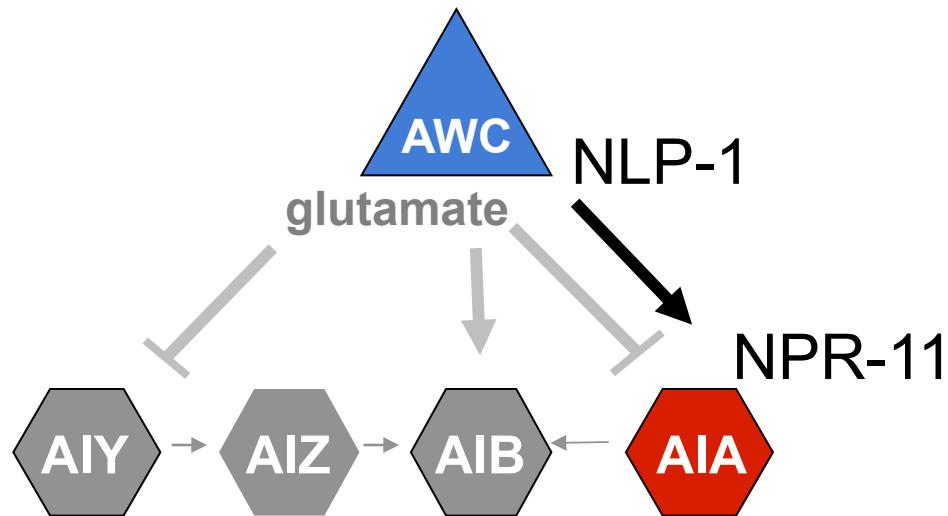

- Wild-type
- *glc-3* mutant
- AWC ablation

Chalasani, 2007 & 2010

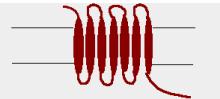

# A *C. elegans* odor circuit, the vertebrate retinal circuit

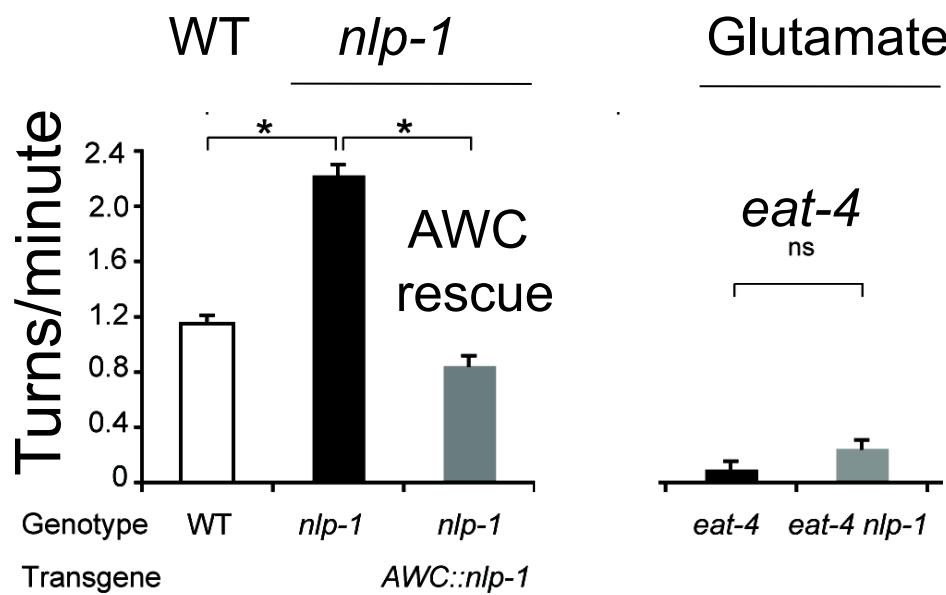

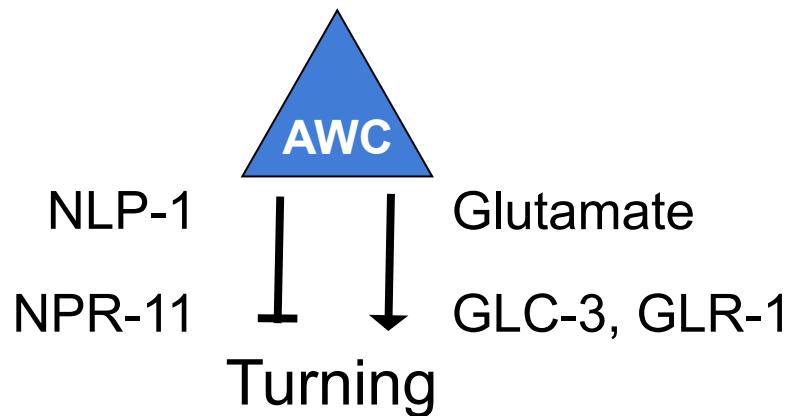

# AWC also makes a neuropeptide transmitter

NLP-1 (buccalin-like neuropeptide)

NPR-11 (sNPFR-like GPCR) 

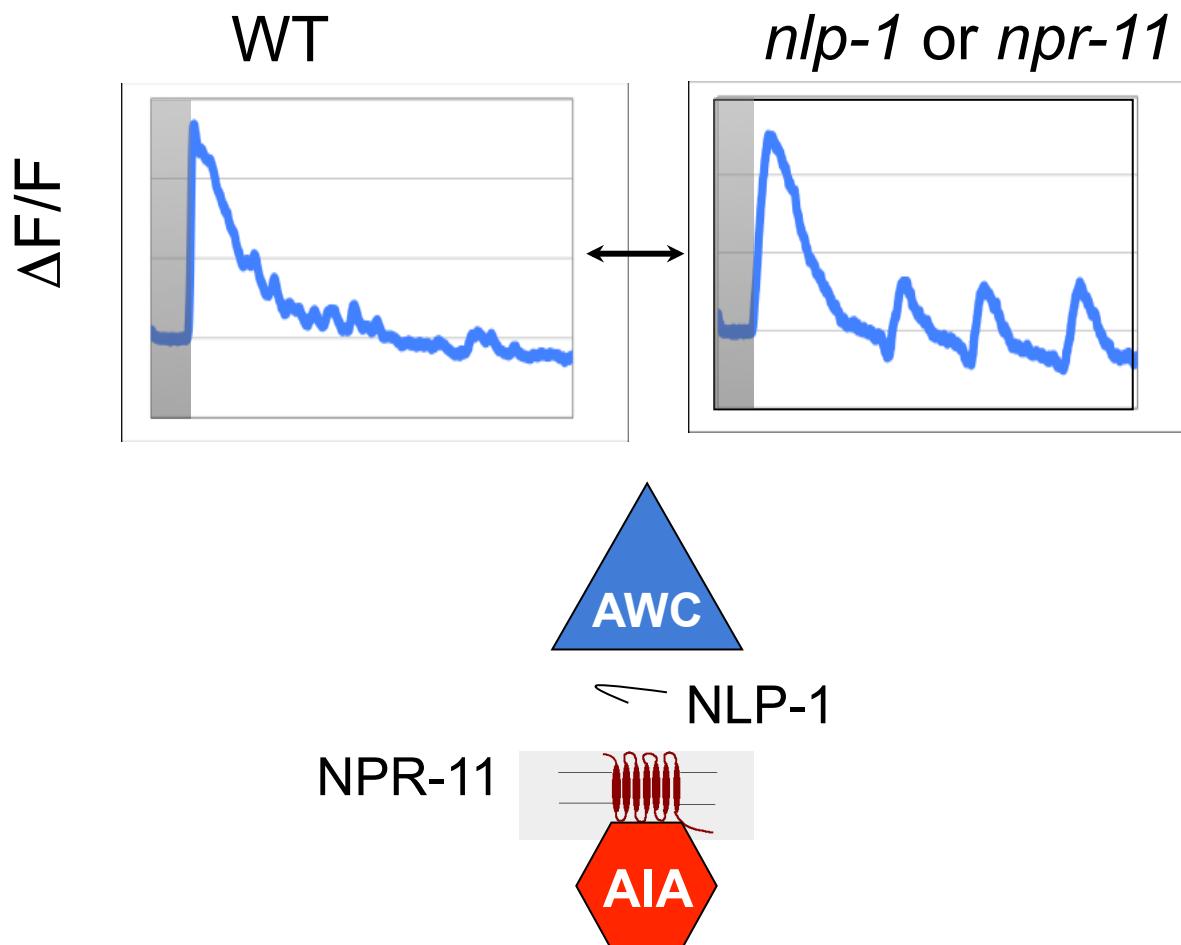

# The NLP-1 neuropeptide antagonizes AWC glutamate

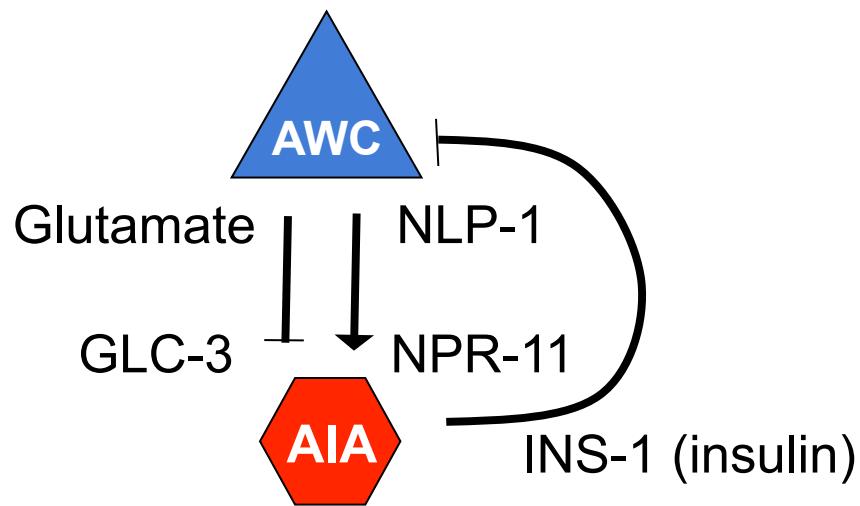

Chalasani et al., Nature Neuroscience 2010

# NLP-1 (AWC peptide) and NPR-11 (AIA receptor) affect odor responses in **AWC**

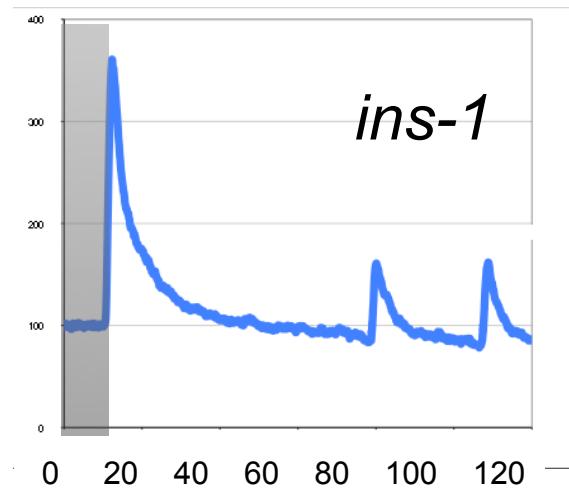

Calcium imaging (odor removal)

An insulin-like peptide made by AIA feeds back onto AWC

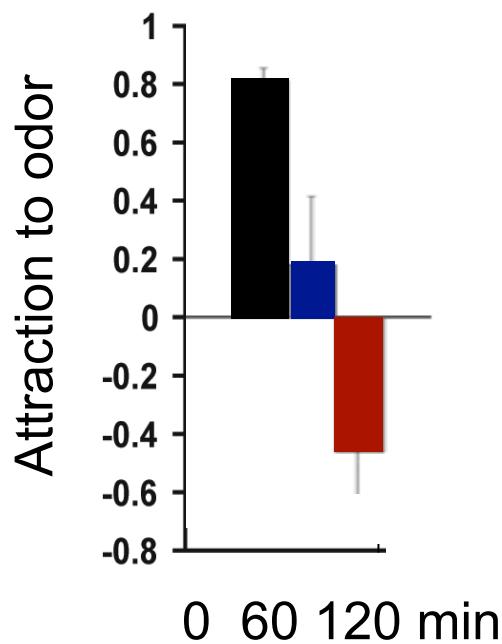

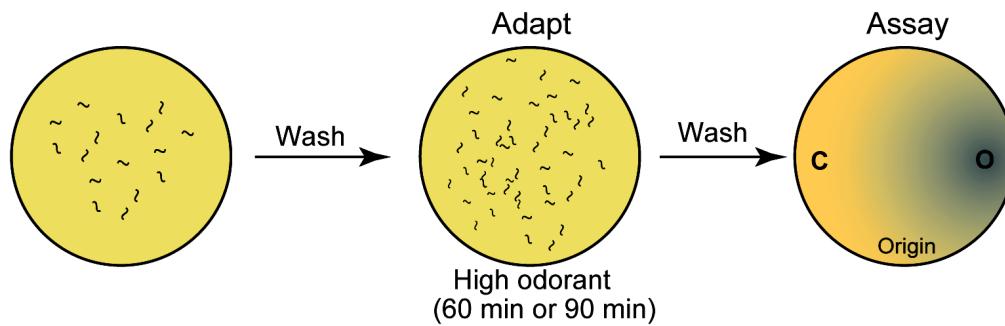

AWC calcium imaging

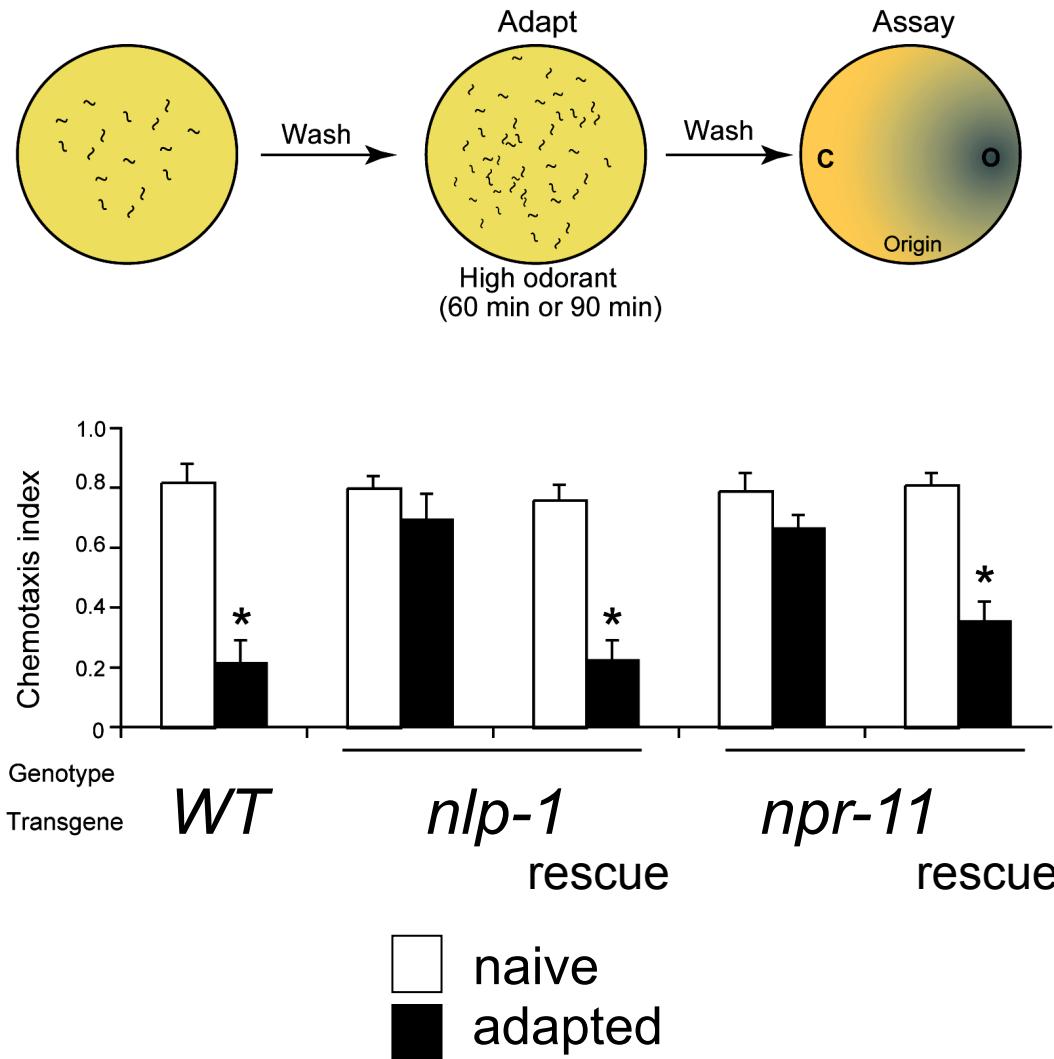

Chalasani et al., Nature Neuroscience 2010

# Odor preference is modified by odor experience

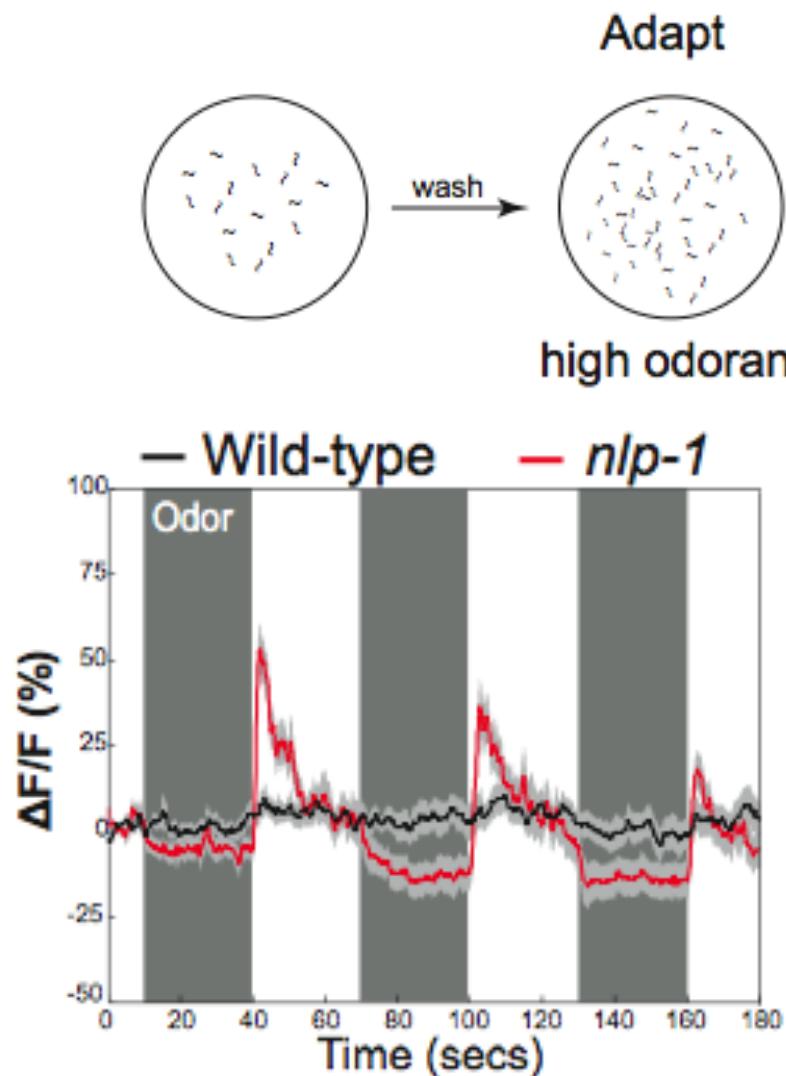

# The NLP-1/INS-1 feedback loop drives olfactory adaptation

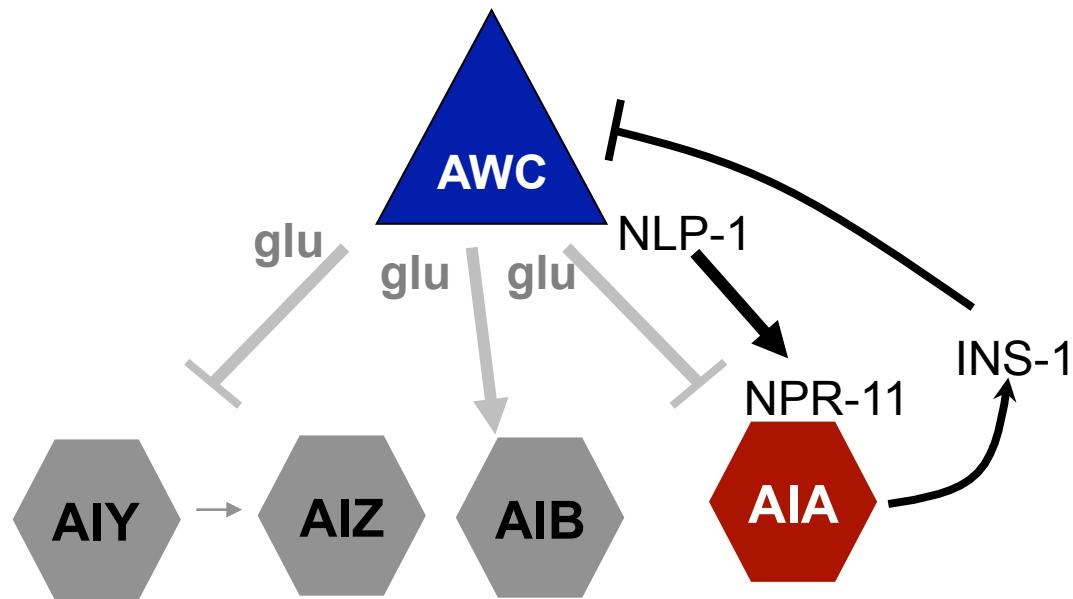

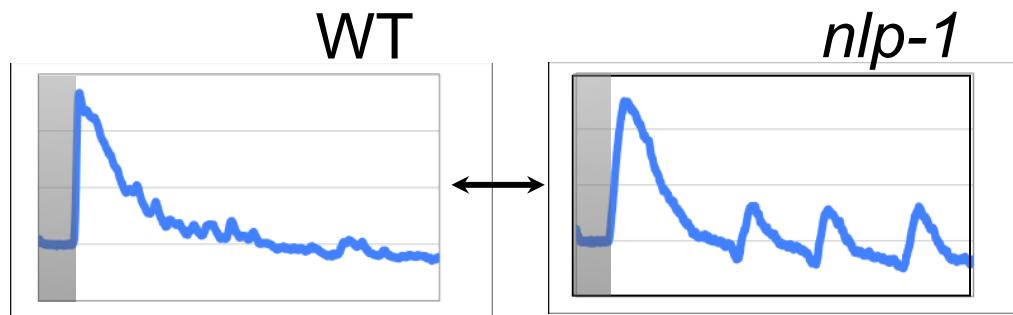

Chalasani et al., Nature Neuroscience 2010

Adaptation reduces AWC odor responses --  
This requires *nlp-1*, *npr-11*, and *ins-1*

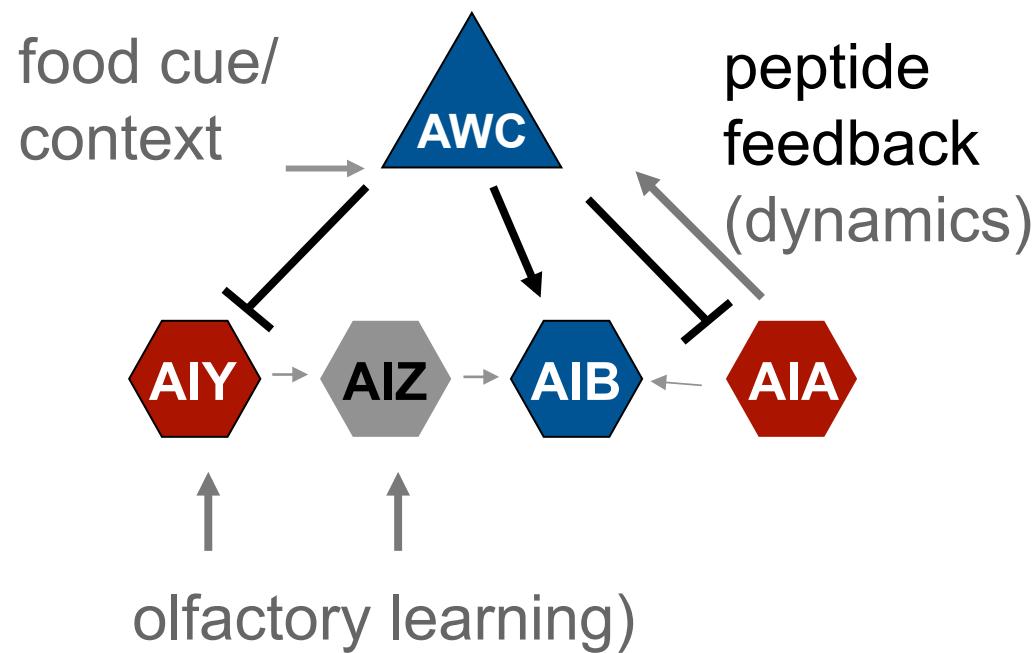

Chalasani et al., Nature Neuroscience 2010

# Neuropeptide feedback shapes sensory dynamics

Chalasani et al., Nature Neuroscience 2010

# Circuits change over time

Dirk Albrecht

Sreekanth Chalasani (now at Salk)
