

iBio Seminars Part II:
Looking for functional rafts in cell membranes

Satyajit Mayor
National Centre for Biological Sciences (NCBS),
Bangalore, India

in collaboration with

Madan Rao
Raman Research Institute (RRI) , Bangalore

Clathrin/Dynamin-dependent endocytosis

Clathrin/Dynamin-dependent endocytosis

GPI-anchored proteins are endocytosed via a specialized pathway 'the GEEC pathway'

- Sabharanjak, Sharma et al. *Dev. Cell* (2002)
- Mayor and Riezman, *Nature Reviews* (2004)
- Kirkham et al. *J. Cell Biol.* (2005)
- Kalia et al. *Mol. Biol. Cell* (2006)
- Chadda et al. (2007)

GPI-anchored proteins are internalized via an
pinocytic pathway that is

- Constitutive
- Lipid-selective
- Lipid-dependent
- Cdc42-regulated
- Actin-dependent

Does not utilize

- Dynamin
- Clathrin/ Caveolin
- Arf6
- RhoA
- Rac1

Membrane Rafts?

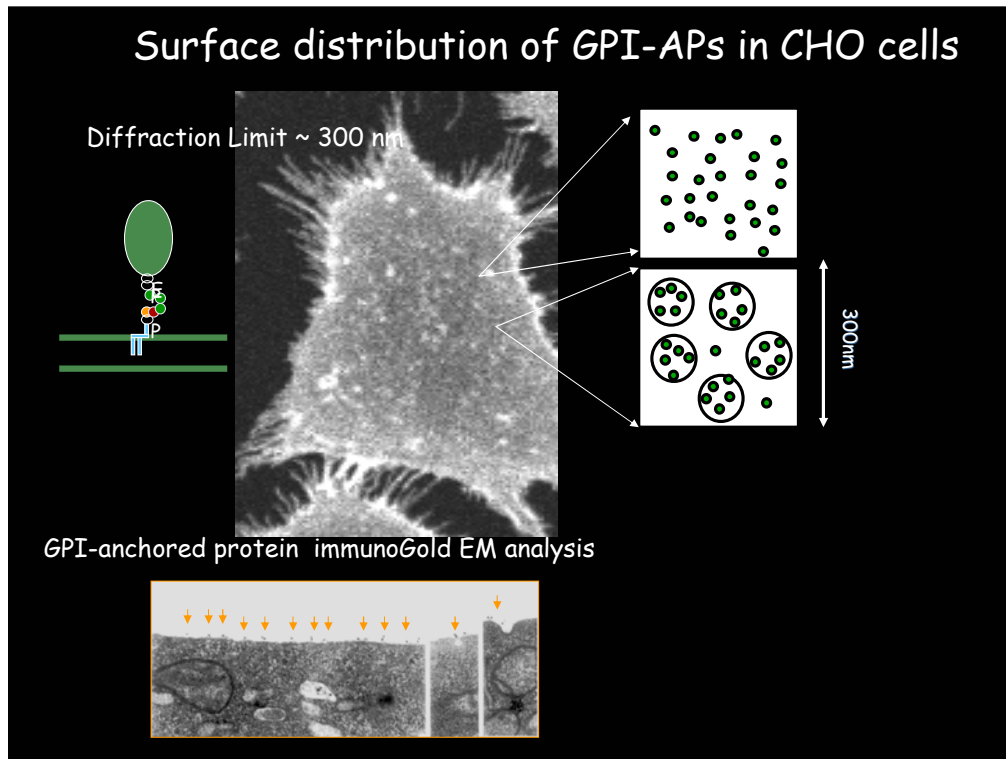

- dynamic clustering of cholesterol and sphingolipids to form domains in membranes
- platforms for the segregation of specific proteins responsible for sorting and signaling function

Looking for rafts

- detergent insolubility
- diffusion measurements
- proximity-based methods

Proximity-based methods to examine segregation of GPI-anchored proteins

EM analysis (Mayor et al, *Science*, 1994; Prior et al, *JCB* 2003; Madore et al, *EMBO J* 2002)

Chemical crosslinking *in situ* ~ microdomains:
(Friedrichson and Kurzchalia, *Nature* 1998; Paladino et al, *JCB*, 2004)

Forster's Resonance Energy Transfer (FRET)
(Varma and Mayor, *Nature* 1998; Kenworthy et al., *JCB*, 1998; Sharma et al, *Cell*, 2004)

The FRET scale- A spectroscopic ruler $R_0 \sim 1 - 10 \text{ nm}$

$$E = [1 / \{1 + (r/R_0)^6\}]$$

$$R_0 = 8.79 \cdot 10^{-5} [n^{-4} \cdot Q \cdot \kappa^2 \cdot J(\lambda)]^{1/6} \text{ \AA}$$

$$\kappa^2 = [\cos\theta_T - 3\cos\theta_A \cdot \cos\theta_D]$$

The FRET scale- A spectroscopic ruler

$R_0 \sim 1 - 10 \text{ nm}$

homo-FRET

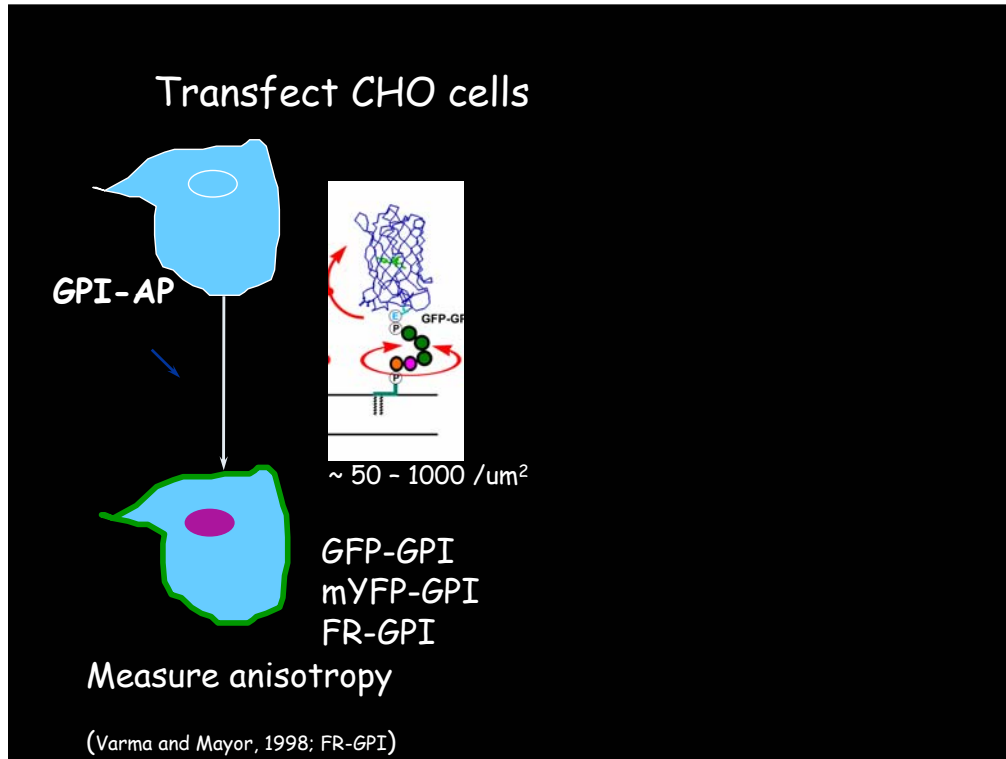

Depolarization FRET

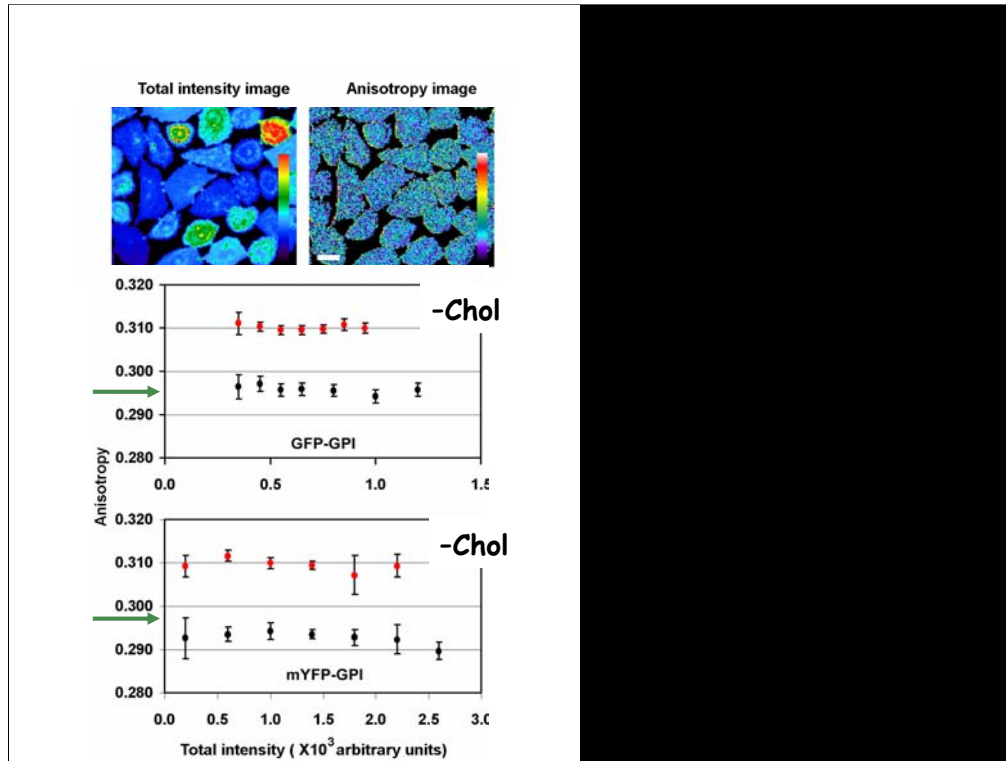

measure fluorescence
anisotropy

Varma and Mayor, *Nature* (1998)

Organization of GPI-anchored proteins in a microscope pixel

Random

Organization of GPI-anchored proteins in a microscope pixel

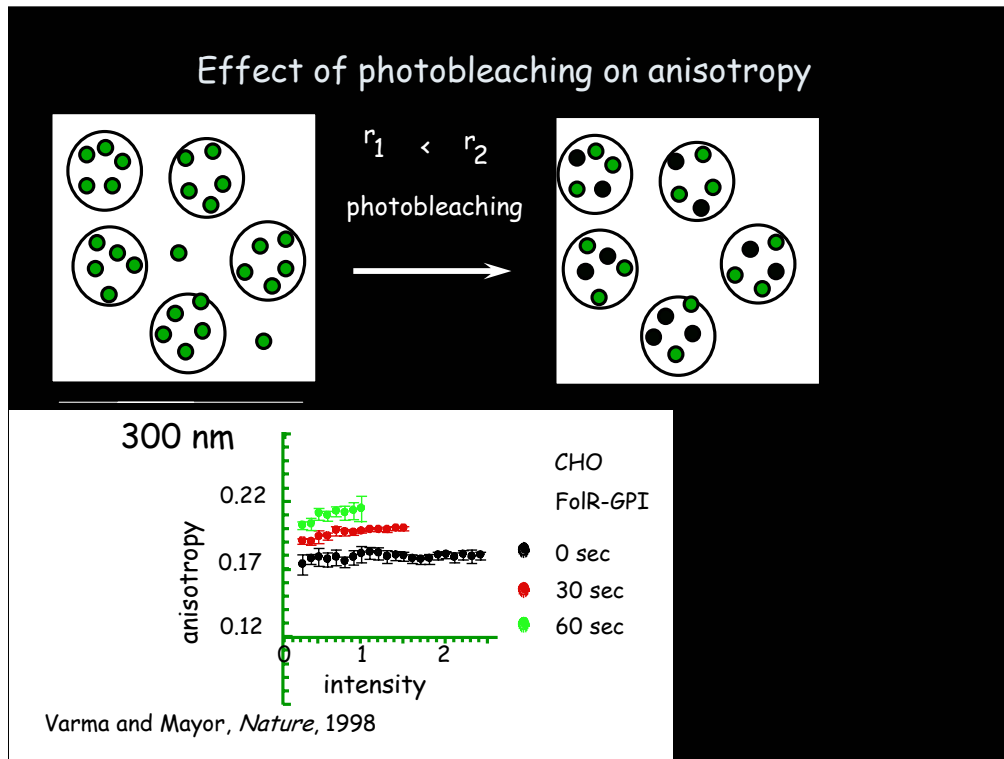

300 nm
← →
(small clusters)

Organization of GPI-anchored proteins in a microscope pixel

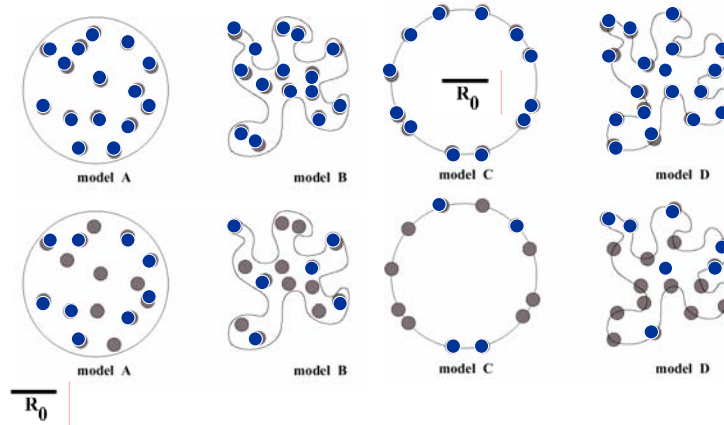

high density ≤ 4 nm separation
From Time Resolved Fluorescence
anisotropy measurements

300 nm
(small clusters)

Possible architecture of domains

- change of anisotropy after photobleaching
- theoretical models

Possible architecture of domains in living cells?

Structure of the FRET-species

(Data taken from cells with 20 fold different protein density)
Sharma, Varma, Sarasij et al., *Cell* 2004

Mainly monomers and 20-40 % as nano-clusters -

Sharma, Varma, Sarasij et al., *Cell* 2004

GPI-APs are organized as monomers and mixed nano-clusters

GPI-APs are flexibly organized as monomers and mixed nano-clusters

GPI-APs are flexibly organized as monomers and mixed nano-clusters

GPI-APs are flexibly organized as monomers and mixed nano-clusters

Organization of lipid-anchored proteins in plasma membranes

(Hancock, *Nature Reviews (MCB)*, 2003)

Crosslinking GPI-anchored proteins induces H-Ras-domains to coalesce suggesting a trans-bilayer connection

Prior et al , JCB, 2003

Other (glyco)lipids also show a clustered distribution

Gangliosides *GM1* and *GM3*
exhibit a similar nano-clustered
distribution

sensitive to cholesterol depletion
cold temperatures
concentration independent

— Fujita, et al. *MBC* (2007)

Lipid-anchored proteins and lipids are flexibly organized as monomers and nano-clusters

Endocytosis of GPI-anchored proteins and nanoclusters?

Crosslinked GPI-anchored proteins are not endocytosed via the GEEC-pathway

Functional Rafts : A working hypothesis

pre-existing organization

induced rafts

Sorting or Signaling Function

Mayor and Rao, *Traffic* (2004)

Functional Rafts : A working hypothesis

pre-existing organization

induced rafts

Sorting or Signaling Function

What makes nano-clusters?

What induces functional domains?

Mayor and Rao, *Traffic* (2004)

Functional Rafts : A working hypothesis

pre-existing organization

induced rafts

Similarities in properties suggest similar mechanisms for formation for different lipid-anchored molecules

Unlikely to be a passive mechanism involving thermodynamic phase separation
